

HYDRAULIC TORQUE WRENCH TESTER

This application shows a TTT (Torque Tool Tester) incorporated into a universal hydraulic torque wrench tester designed by our Danish distributor, Dansk Moment Teknik.

The TTT coupled with a 7000 N.m 'SMART' transducer covers a range of 700-7000 N.m providing a fully traceable system to national standards.

Designed for use in harsh environments, the TTT and transducer are protected by a steel cover (not shown above).

Multiple adaptors allow the majority of common hydraulic wrenches, both imperial and metric to be tested on this self-reacting unit.

The TTT also offers the flexibility of a second transducer port than can be connected to one of our 'SMART' range of transducers (up to a maximum value of 100,000 N.m) allowing a second station to be added for the testing of other types of torque tools.
